BIZTRACK – SMALL BUSINESS MANAGER APPLICATION

Submitted by

Trupti Avhadkar

Section- B4

Roll No- 26

Under the Guidance of

Prof. Ashish Chandak

Academic Year: 2026 – 27

1. Introduction

BizTrack is a mobile-first Progressive Web Application developed to help small businesses manage daily operations. It brings together product inventory, sales, expenses, and business reports in a simple interface that can be accessed using a modern browser.

The application allows users to add and manage products, record sales and expenses, view stock alerts, and export records as CSV files. Data is stored locally on the device. BizTrack is designed to make everyday business record management more organized and convenient.

2. Objectives

The main objectives of the BizTrack application are:

- To provide a simple platform for managing small business records.
- To display sales, expenses, net profit, and stock information.
- To allow users to add, edit, delete, and search products.
- To maintain sales and expense records using local storage.
- To display low-stock alerts and business reports.
- To create an installable, mobile-friendly Progressive Web Application.

3. Technology Stack and Concepts Used

The following technologies and concepts were used in developing the BizTrack application.

HTML: Used to structure the dashboard, inventory, sales, expenses, and report screens.

CSS: Used to design the responsive, mobile-first user interface and navigation.

JavaScript: Used to implement application logic, form validation, calculations, and screen navigation.

Local Storage: Used to save product, sales, and expense records on the device.

Progressive Web App: A web manifest supports installation from a compatible browser.

Service Worker: Used for offline caching of the application shell when served over HTTPS or localhost.

Event Handling: Button and form listeners handle product management, sales, expenses, and navigation.

CSV Export: Used to export product, sales, and expense records.

5. Result

The BizTrack application provides a mobile-friendly interface with screens for managing products, sales, expenses, and reports. Users can record transactions, search and update products, review low-stock alerts, and export business records as CSV files.

The application stores records in browser local storage and calculates dashboard totals from recorded sales and expenses. Its reports display sales versus expenses and sales by product. It also includes validation and stock checks when recording sales.

6. Conclusion

BizTrack provides an organized approach to managing basic small business operations. The project demonstrates the use of HTML, CSS, JavaScript, browser local storage, responsive interfaces, and Progressive Web App concepts.

The application combines inventory, sales, expenses, and reporting features in a single mobile-first interface.

7. Future Scope

The application can be enhanced in the future by adding the following features:

- **Cloud Synchronization: Synchronize business records across multiple devices.**

- **User Authentication: Allow business owners to log in securely.**
- **Notifications: Notify users about low-stock products.**
- **Multi-user Access: Enable authorized staff to manage shared business records.**
- **Advanced Reports: Add date-based filters and more detailed business insights.**
- **Cloud Backup: Store business data online for recovery across devices.**
